

# Naming impairment in Dutch patients with MS – Explorative study

*MASTER THESIS OF ROBIN 'T HART*

PRESENTED BY LEONIE RUHAAK

# Introduction

## **Word-finding difficulties**

- What?
- When?
- What do patients experience?
- Diagnosis?
- Treatment?

## **Motivation for research**

# Objectives

1. Do MS patients experience word-finding difficulties?
  - ▶ Are MS patients able to tell that they have a naming impairment?
2. What is the relationship between naming impairment, cognition and disease disability?
3. Which (distorted) underlying processes may influence a naming impairment?

# Methods

## **Nederlandse Benoem Taak (Dutch Naming Test)**

Diagnosis of naming impairment.

## **VAS-Schaal**

'Self-reported severity' of word-finding difficulties.

## **MOCA**

Cognitive functioning.

## **EDSS**

Disability score.

# Results

## 2. What is the relationship between naming impairment, cognition and disease disability?

EDSS

MOCA and Dutch Naming Test

MOCA explains 49.6% of Dutch Naming Test

Sub-tests (52.9%):

Attention;

Orientation;

Abstraction.

# Results

## 3. Which (distorted) underlying processes may influence a naming impairment?

Classification:

- Fonological;
- Semantic;
- Visual;
- Others.

# Results

■ Semantical ■ Phonological ■ Visual Errors ■ Errors

# Discussion

- ▶ Language problems in MS?
  - ▶ Sometimes apparent, sometimes not → in line with literature
- ▶ Patients with MS are not able to judge their language abilities.
  - ▶ Disease awareness
- ▶ Most errors are semantic errors.

# Discussion

- ▶ Disability (EDSS) has no relation with scores on the Dutch Naming Test.
  - ▶ EDSS is removed from the regression model.
- ▶ MOCA explains half of the scores on the Dutch Naming Test.
  - ▶ The subtests of the MOCA responsible for this relationship, are not language related subtests.
- ▶ It appears that word-finding difficulties in MS are due to a combination of more general cognitive processing difficulties, combined with a decline in semantic memory and lexical access.

# Conclusion

- ▶ 30% of the participants had naming impairment;
- ▶ Poor awareness of naming impairment;
- ▶ Most errors are semantic errors;
- ▶ It remains unclear which cognitive/linguistic functions are involved in confrontational naming
